WATER

ABOUT EIGHTPLUS

"YOUR GO TO DRINK TO BALANCE YOUR LIFE"

Alkaline Water started out as a quest to develop the world's best-tasting water while also utilizing new trends.

Eight-plus tastes as good as it feels. Enhanced with a pH above 8, electrolytes, and minerals, Eight-plus is a premium water-based electrolyte beverage. This can offer a longer-lasting solution for the body to adjust to a healthy and active lifestyle.

The minerals calcium, magnesium, potassium, and sodium have the ability to give strength to the body and speed up hydration. When our body's acid-alkaline balance is maintained at the proper pH level we experience good health and prevent degenerative diseases. Therefore, maintaining our body's pH and electrolyte balance is crucial.

Alkaline water helps to restore pH balance, increases energy levels, increases hydration, improves immunity which goes a long way in helping you stay healthy.

Be active and maintain a healthier lifestyle.

EIGHTPLUS PROCESS

EIGHTPLUS water is processed carefully and efficiently through

- 💧 Multistage filtration
- 💧 R.O processing
- 💧 U.V sterilization
- 💧 Ozonization

And it is further enriched by adding electrolyte minerals to make it a premium water-based beverage.

HEALTH BENEFITS OF EIGHTPLUS ALKALINE WATER

- 💧 Helps more effectively by absorbing nutrients and neutralizing acid in your bloodstream.
- 💧 It contains tiny clusters of water molecules that cells can absorb more easily.
- 💧 It efficiently gets rid of toxins and defends against constipation, flatulence, and stomach issues.
- 💧 Its extraordinary capacity for hydration aids in the flexibility and renewal of skin tissue.
- 💧 It facilitates digestion and breaks down fatty acids enabling you to feel revived Without consuming calories.

ALKALINE WATER V/S REGULAR WATER

1. Alkaline water has a higher pH level than regular drinking water.
2. Alkaline water can neutralize the acid in your body.
3. Normal drinking water generally has a neutral pH of 7.
4. Alkaline water typically has a pH of 8 or 9.

- 💧 However, pH alone isn't enough to impart substantial alkalinity to water.
- 💧 Alkaline water must also contain alkaline minerals and negative oxidation-reduction.
- 💧 Potential (ORP) ORP is the ability of water to act as a proper antioxidant. The more negative the ORP value, the more anti oxidizing it is.
